A; Mesidues: 1-97 < MAN>
A; Residues: 1-97 < MAN>
C; Comment: This antibody is produced by Epstein-Barr virus-transformed B cell that bears C; Comment: This antibody is produced by Epstein-Barr virus-transformed B cell that bears C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin homology < IVM>
F; 30-35/Region: complementarity-determining 1
F; 49-66/Region: complementarity-determining 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 11
PH0875
Ig heavy chain V region (anti-DNA, H2F) - human (fragment)
C;Species: Homo sapiens (man)
C;Species: Homo sapiens (man)

The consensus variable domain sequences are derived from the most abundant sublasses in the sequence compilation of Kabat et al., Sequences of Proteins of Immunological Interest, National Institutes of Health, Bethesda MD (1987), namely, VL-Kappa subgroup I and VH group III. In such igG-gamma-1 human consensus sequences, the VI consensus domain has the AA sequence in AAR47041, and the VH consensus domain has the AA sequence in AAR47042. (Updared on 25-MAR-2003 to correct PN field.)

The antibody binds to a target structure displayed in and on the cell surface of human gastrointestinal epithelial tumour cells and in a subpopulation of normal human gastrointestinal epithelial cumour cells and transet structure especially comprises alphaébeta4 integrin. The target structure especially comprises alphaébeta4 integrin. This is a tumour-associated antigen. The antibody, and its fragments, are useful for treating human metastatic and malignant disease, for in vivo diagnosis and prognosis of human malignant disease, comprising tumour typing, tumour screening, tumour diagnosis and monitoring premallignant conditions. Quantitative in vivo diagnosis is carried out by determining the localization of antibody to
                                                                                                                                                                                                                  Novel antibody for diagnosis, treatment of human metastatic and malignant diseases, has binding structure for target structure displayed on cell surface of human gastrointestinal epithelial tumor and normal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention relates to a phage display library of variable heavy domain (VHH or VH) fragments (sdAb fragments) derived from llama antidodies. The library is useful for in vitro selection against any fragments are isolated from the library using phage display technology fragments are isolated from the library using phage display technology and an antibody serving as an antigen. Such anti-idiotypic antibody fragments have great potential in evoking the immune system response to pathological antigens and in vaccine development. The large size of the library considerably increases the probability of isolating from it antigen-binding fragments having high affinity to almost any predetermined target (antiden of interest). The library eliminates the development of anti-idiotypic antibodies by immunisation and allows isolation of anti-idiotypic antibodies. AAUG2435-AAUG2635 represent the lamma heavy chain domain fragments of the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New phage display library of variable heavy domain antigen-binding fragments derived from llama antibodies, useful for in vitro selection against any antigen of interest as a target.
                                                                                                                                                                                                 Llama; phage display library; variable heavy domain fragment; VHH; VH; sdAb fragment; single domain anti-idiotypic antibody fragment; phage display technology; immune system response; CDR1/H1; CDR2; CDR3; complementarity determining region.
                                                                                                                                                               Llama CDR2 region variable heavy chain fragment #61.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Page 19a; 46pp; English.

```
The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-Ser-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence val-His-His-Glu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA89887 or its fragment. Also described: (I) a mucleic acid molecule encoding (I); (2) a vector comprising the nucleic acid of (I); (3) a host cell comprising the vector of (2); (4) preparing (I), comprising (I) culturing the host cell of (3) under conditions that allow synthesis of (I) and recovering (I) from the culture; (5) a composition comprising (I) nucleic acid of (I), vector of (2) or host cell of (3); (7) optimising (I), uncleic acid of (1), vector of (2) or host cell of (3); (7) optimising (I); (8) testing the resulting Fab optimised clones; (10) expressing of selected, optimised clones; (11) preparing a pharmaceutical composition, comprising optimisation of (I), and formulating the composition of (I), and carrier, and (12) a
                                                                                                                                                                                                                                                                                                                                                                                                nootropic; antiparkinsonian, gene therapy; amyloidogenesis; amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia; Alzheimer: disease; mctor neuropathy; Down's syndrome; Crettzfeldt Jacob disease; hereditary cerebral haemorrhage; amyloidosis; Parkinson's disease; HIV-related dementia; amyotrophic lateral sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antibody molecule capable of specifically recognizing two regions of
the beta-A4 peptide, useful for diagnosing, preventing or treating
diseases associated with amyloidogenesis or amyloid-plaque formation

neuroprotective, nootropic and antiparkinsonian activities, and can be used in gene therapy. The antibody molecule (1), nucleic acid molecule, vector or host is useful in preparing a pharmaceutical composition for the prevention and/or treatment of a disease associated with amyloidogenesis and/or amyloid-plaque formation. The antibody molecule may also be used in preparing a diagnostic composition for the detection of the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease is dementa, Alzheimer's disease, metor neuropathy, Down's syndrome, Creutzfeldt Jacob disease, horeditary cerebral haemorrhage with amyloidosis Dutch type, Parkinson's disease, HIV-related dementia, and parkinson's disease, nor neuropathy. Down's syndrome, amyloidosis Dutch type, Parkinson's disease, HIV-related dementia, and parkinson's any or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nootropic; antiparkinsonian; gene therapy; amyloidogenesis; amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia; Alzheimer; disease; motor neuropathy; Down's syndrome; Creutzfeldt Jacob disease; hereditary cerebral haemorrhage; amyloidosis; Parkinson's disease; HIV-related dementia; amyotrophic lateral sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ō
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antibody molecule; antibody; beta-A4 peptide; Abeta4; neuroprotective;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antibody molecule capable of specifically recognizing two regions the beta-A4 peptide, useful for diagnosing, preventing or treating diseases associated with amyloidogenesis or amyloid-plaque formation
                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Kretzschmar T;

```

The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-App-Ser-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-Glu-Lys-Leu-Val-Phe-Phe-Ala-Glu-Abp-Val-Gly-AbB9887 or its fragment. Also described: (I) a mucleic acid molecule encoding (I); (2) a vector comprising the nucleic acid of (I); (3) a host cell comprising the vector of (2); (4) preparing (I), comprising the vector of (2); (4) preparing (I), comprising (I) culturing the host cell of (3) under conditions that allow synthesis of (I) an antibody molecule produced by method (4); (6) a kit comprising (I), or an antibody molecule produced by method (4); (6) a kit comprising (I), or an antibody molecule produced by method (4); (6) a kit comprising (I), concepting the resulting Fab optimisation library by panning against Abeta/Abeta4; (9) identifying optimised clones; (10) expressing (1); (1) testered, optimised clones; (11) preparing a pharmaceutical composition prepared by method (8). (I) has composition, comprising optimisation of (I), and formulating the composition prepared by method (8). (I) has controprotective, nootropic and antiparkinsonian activities, and can be consed in gene therapy. The antibody molecule (1), nucleic acid molecule, the prevention and/or treatment of a disease associated with antipody molecule of any formulation and constitution and companied and antiparkinsonian antipody molecule of a disease associated with antipody molecule of any formulation and constituted any formulation and constituted any formulation and constituted any formulation and constituted any formulation and constituted any formulation and constituted any formulation and constituted any formulation and constituted any formulation and constituted any formulation and constituted any formulation and constituted any formulation and constituted any formulation and constitute

may also be used in preparing a diagnostic composition for the detection of the disease mentioned above. The antibody is used for the distinceration of beta-amyloid plaques or for passive immunisation against beta-amyloid plaque for for passive immunisation dementia, Alzheimer's disease, motor neuropathy, Down's syndrome, Creutzfeldt Jacob disease, hereditary cerebral haemorrhage with amyloidosis Dutch type, Parkinson's disease, HIV-related dementia, amyotrophic lateral sclerosis or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antibody molecule, antibody; beta-A4 peptide, Abeta4; neuroprotective; nootropic; antiparkinsonian; gene therapy; amyloidogenesis; amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia; Alzheimer; Gisease; motor neuropathy; Down's syndrome; creutzfeldt Jacob disease; hereditary cerebral haemorrhage; amyloidosis; Parkinson's disease; HIV-related dementia; amyotrophic lateral sclerosis;

The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-App-Ser-Gly-Tyr ADAB9886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADAB9886 or its fragment. Also described: (1) a mucleic acid molecule cocding (I); (2) a vector comprising the nucleic acid of (1); (3) a host cell comprising the vector of (2); (4) preparing (I), comprising of (2) under conditions that allow synthesis of (2) and recovering (I) from the culture; (5) a composition comprising (I) and recovering (I) from the culture; (5) a composition comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I) and recovering (I) from the culture; (5) a composition comprising (I); (8) testing the resulting Fab optimisation library by panning (I); (8) testing the resulting Fab optimised clones; (10) expressing (I); (8) testing the resulting Fab optimised clones; (10) expressing (1); (8) testing the resulting potimised clones; (10) expressing (1); (8) testing optimisation of (1); (9) testing optimisation of the decreation of selected, optimised clones; (11) preparing a pharmaceutical composition for the prevention and/or antibody molecule with a carrier; and (12) a composition preparing a pharmaceutical composition for the detection cor host is useful in preparing a pharmaceutical composition for the dreamyloid degenesis and/or amyloid-plaque formation. The antibody molecule cor the prevention and/or treatment of a disease associated with amyloid ogenesis and/or amyloid plaques for passive immunisation cor the detection of beta-amyloid plaques or for passive immunisation cor dementian beta-amyloid plaques or for passive immunisation cor dementian beta-amyloid plaques or for passive immunisation cor dementian beta-amyloid plaques or proper the prevention of beta-amyloid plaques or post tor passive immun Creutzfeldt Jacob disease, hereditary cerebral haemorrhage with amyloidosis Dutch type, Parkinson's disease, HIV-related dementia, amyotrophic lateral sclerosis or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention. dementia, Alzheimer's disease, motor neuropathy, Down's syndrome,

Kretzschmar T;

New antibody molecule capable of specifically recognizing two regions of the beta-A4 peptide, useful for diagnosing, preventing or treating diseases associated with amyloidogenesis or amyloid-plaque formation (e.g. dementia).

Example 13; Page 92; 312pp; English.

The present invention describes an antibody molecule (I) capable of frequency comprises the amino acid sequence Ala-Glu-Phe-Aapper (1) and comprises the amino acid sequence Ala-Glu-Phe-Aapper (2) are region comprises the amino acid sequence or an antibody molecule caid molecule amino acid sequence Val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly-Aba89886 or its fragment, and the second region comprises the among (1); (2) a vector comprising the nucleic acid molecule caid molecule caid molecule fragment. Also described; (1) a nucleic acid molecule caid (1); (2) a vector comprising the nucleic acid of (1); (3) a host culturing the host cell of (3) under conditions that allow synthesis of culturing the host cell of (3) under conditions that allow synthesis of culturing the host coll of (3) under conditions that allow synthesis of culturing the host coll of (3) under coll of (3) a composition comprising (I), uncleic acid of (1), vector of (2) or host cell of (3) a kit comprising (I), uncleic acid of (1), vector of (2) or host cell of (3) a kit comprising (I), uncleic acid of (1), vector of (2) or host in an arbody molecule by method (4); (6) a kit comprising (I), against Abetea, (9) identifying optimised clones; (10) expressing of squimised antibody molecule with a carrier; and (12) a pharmaceutical composition of (1), and formulating the optimised antibody molecule with a carrier; and (12) a pharmaceutical composition prepared by method (8). (1) has pharmaceutical composition prepared by method (8). (1) has a pharmaceutical composition preparing a disease associated with any also be used in preparing a disease associated with any also be used in preparing a disease associated with any and con of the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used any local places.

Creutzfeldt Jacob disease, motor

pharmaceutical composition prepared by method (B). (I) has neuroprotective, nootropic and antiparkinsonian activities, and can be neuroprotective, nootropic and antiparkinsonian activities, and can be neuroprotective, nootropic and antiparkinsonian activities, and can be cused in gene therapy. The antibody molecule (I), nucleic acid molecule, vector or host is useful in preparing a pharmaceutical composition for the prevention and/or amyloid-plaque formation. The antibody molecule can also be used in preparing a diagnostic composition for the detection of the disease mentioned above. The antibody is used for the detection of the disease mentioned plaques or for passive immunisation of place amyloid plaques for previous, the disease is dementia, Alzheimer's disease, motor neuropathy. Down's syndrome, canyloidosis Dutch type, Parkinson's disease, INU'related dementia, anyloidosis Dutch type, Parkinson's disease, INU'related dementia, anyloidosis but seed in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to novel immunoglobulin molecules that comprise at least one antibody variable chain VH or VL framework region and are capable of binding to a specific antigens within an intracellular environment. Specifically, it refers to antibodies that can form an insoluble complex with a cognate antigen, such that it can then be target for degradation via the lysosome or proteosome systems. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Use of an intracellularly binding immunoglobulin comprising at least one antibody variable chain, in preparing a medicament for degrading one or more specific antigens, or for treating specific antigen positive cancer, e.g. leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      VH chain clone J48 of an intracellularly binding immunoglobulin SeqID 41
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antibody; variable chain; cytostatic; cytoplasmic degradation; intracellular relocation; specific antigen positive cancer; leukaemia; lymphoma; intracellularly binding immunoglobulin; ras.

and reagent applications or in functional genomics. This polypeptide sequence is a variable heavy chain (VH) framework region of an intracellularly binding anti-ras antibody of the invention.

diagnostic applications both in vitro and in vivo, as well as for

```
invention describes the specific target antigen as the oncogenic fusion protein BCR-ABL or the RAS antigen, such that this method can be used to prepare a cytostatic medicament for the cytoplasmic degradation or intracellular relocation of such an antigen or for the treatment of the specific antigen positive cancer i.e. leukaemia or lymphoma. Furthermore, the immunoglobulins may also be used for therapeutic, prophylactic or diagnostic applications both in vitro and in vivo, as well as for assay and reagent applications or in functional genomics. This polypeptide sequence is a variable heavy chain (VH) framework region of an intracellularly binding anti-ras antibody of the invention.

ö one VH framework region amino acid sequence showing at least 85 % identity with the framework region consensus sequence (1), and/or a molecule having at least one VH framework region amino acid sequence showing at least 85 % identity with (1), where one or more of amino acids 22 and 92 are not cysteine residues. The immunoglobulin suitable for in vitro use can be produced by a library, generated using any one or more of the VH framework region amino acid sequences cited above. The antibody variable domain type antibody is a heavy or light chain variable domain antibody. The antibody comprises at least light and at least heavy chain variable domain. The immunoglobulin molecule is useful for the specific of a ligand within an in vitro environment. Sequences ADP66604-represent variable domain heavy chain (VH) sequences of anti-RAS The invention relates to an immunoglobulin molecule comprising at least Gaps 74.1%; Score 63; DB 8; Length 115; 81.2%; Pred. New immunoglobulin molecule comprising at least one VH framework region amino acid sequence, useful for the specific binding of a ligand within

vitro environment

2 ISENGRTINYADSVKG 17

ઠ

This invention relates to novel immunoglobulin molecules that comprise at capable of binding to a specific antigens within an intracellular environment. Specifically, it refers to antibodies that can form an insoluble complex with a cognate antigen, such that it can then be target insoluble complex with a cognate antigen, such that it can then be target for degradation via the lysosome or proteosome systems. The present invention describes the specific target antigen as the oncognic fusion protein BCR-ABL or the RAS antigen, such that this method can be used to prepare a cytostatic medicament for the cytoplasmic degradation or intracellular relocation of such an antigen or for the treatment of the specific antigen positive cancer i.e. leukaemia or lymphoma. Furthermore, the immunoglobulins may also be used for therapeutic, prophylactic or

Use of an intracellularly binding immunoglobulin comprising at least one antibody variable chain, in preparing a medicament for degrading one or more specific antigens, or for treating specific antigen positive cancer, e.g. leukemia.

The invention relates to an immunoglobulin molecule comprising at least to one VH framework region amino acid sequence showing at least BS $ identity with the framework region consensus sequence (1), and/or a molecule having at least one VH framework region amino acid sequence showing at least one VH framework region amino acid sequence can be or cysteine residues. The immunoglobulin suitable for in vitro use can be produced by a library, generated using any one or more of the VH framework region amino acid sequences cited above. The antibody variable domain type antibody is a heavy or light chain variable domain antibody. The single mantibody comprises at least light and at least heavy chain variable domain. The immunoglobulin molecule is useful for the specific binding of a ligand within an in vitro environment. Sequences ADP66604-ADP66611 represent variable domain heavy chain (VH) sequences of anti-RAS
                                                                                                                                                                                                                                                                                           New immunoglobulin molecule comprising at least one VH framework region amino acid sequence, useful for the specific binding of a ligand within an in vitro environment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

New immunoglobulin molecule comprising at least one VH framework region amino acid sequence, useful for the specific binding of a ligand within an in vitro environment.

Example 3; Fig 3; 67pp; English.

one VH framework region amino acid sequence showing at least 85 \$\frac{4}{8}\$ identity with the framework region consensus sequence (I), and/or a molecule having at least one VH framework region amino acid sequence showing at least 85 \$\frac{4}{8}\$ identity with (I), where one or more of amino acids sequence showing at least 85 \$\frac{4}{8}\$ identity with (I), where one or more of amino acids 22 and 92 are not cysteine residues. The immunoglobulin suitable for in vitro use can be produced by a library, generated using any one or more of the VH framework region amino acid sequences cited above. The antibody of the wire acids of the veriable domain type antibody is a heavy or light chain variable domain antibody. The antibody comprises at least light and at least heavy chain variable domain. The immunoglobulin molecule is useful for the specific binding of a ligand within an in vitro environment. Sequences ADF66604-ADF66613 represent variable domain heavy chain (VH) sequences of anti-RAS The invention relates to an immunoglobulin molecule comprising at least intracellular scFVs

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description

A.Description: A single VH gene predominates in the rearranged and expressed human B cell
A.Reference number: S24247
A.Accession: S24252
A.Status: preliminary
A.Molecule type: DNA
A.Residues: 1-97 <STE>
A.Molecule type: DNA
A.Residues: 1-97 <STE>
G.Superfamily: immunoglobulin V region; immunoglobulin homology
G.Superfamily: immunoglobulin

"Amino acid sequence of the Fv region of a human monoclonal IgM
"Amino acid sequence of the Fv region of a human monoclonal IgM
(protein WEA) with antibody activity against 3,4-pyruvylated
galactose in Klebsiella polysaccharides K30 and K33.";
Proc. Natl. Acad. Sci. U.S.A. 80:4837-4841(1983).
-!- MISCELIANBOUS: THIS CHAIN WAS OBTAINED FROM A MONOCLONAL ANTIBODY
AGAINST 3,4-PYRUVYLATED GALACTOSE AND ISOLATED FROM A PATIENT WITH
WALDENSTROM'S MACROGLOBULINEMIA.
-!- SIMILARITY: Contains 1 immunoglobulin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21-JUL-1986 (Rel. 01, Created)

-!- FUNCTION: Catalyzes the oxidation of L-aspartate to iminoaspartate.
-!- CATALYTIC ACTIVITY: L-aspartate + H(2)O + O(2) = oxaloacetate NH(3) + H(3)O(2).
-!- COPACTOR: FAD.
                                                                                                                                                                                                                                                                       .
